### What is Quantum Volume?

Quantum volume (QV) is a single-number metric used to measure the power of a for near-term devices with a modest number of qubits, and measures the largest and depth that can be reliably run.

IonQ

IonQ is a leader in quantum computing. By making our quantum hardware accessible through the cloud, we're empowering organizations and developers to solve the world's most complex problems in chemistry and materials simulation, logistics and optimization, pharmaceutical and security applications.

Leveraging IonQ's nature-based approach, our systems provide both a viable technological roadmap to scale and the flexibility necessary to explore a wide range of application spaces in the near term.

## Announcing the AWS Center for Quantum Networking

by Denis Sukachev and Mihir Bhaskar | on 21 JUN 2022 | in [Amazon Quantum Solutions Lab](#), [Announcements](#), [A Quantum Technologies](#) | [Permalink](#) | [Share](#)

Over the last decade, governments and technology companies have invested heavily in research and development to revolutionize science and technology. While there is still a long way ahead, these investments have led to significant progress in the field of quantum computing. They have evolved from delicate laboratory systems accessible to only a few research institutions to commercial machines available to researchers, developers, and even quantum enthusiasts worldwide via cloud services.

While quantum computing continues to be a major area of investment and progress for academic and industry research, it is also becoming an increasingly important component of a broader class of quantum technologies. To unlock the full potential of quantum devices, they must be interconnected to form a *quantum network*, similar to the way today's devices are connected via the internet. Despite not receiving the same level of attention as classical computers, quantum networks have fascinating possible applications. One of them is enabling global communication with privacy and security levels not achievable using conventional encryption techniques. Quantum computers can perform certain calculations much faster than classical computers by utilizing the principles of superposition and entanglement. This makes them ideal for tasks such as factorizing large numbers, solving complex optimization problems, and simulating molecular structures. By connecting individual quantum processors via a network, we can harness their collective power to solve problems that are currently beyond the reach of classical computers.

Xanadu

Xanadu is a photonic quantum technology company headquartered in Toronto, Canada. A leader in both quantum hardware and software, Xanadu leads the development of [PennyLane](#), an open-source software library for quantum computing and application development.

Xanadu is on a mission to build quantum computers that are useful and available to people everywhere. We believe that photonics offers one of the most viable approaches to universal fault-tolerant quantum computing. We are proud to provide AWS customers access to Borealis, which our peer reviewed article in Nature shows to be the first programmable photonic quantum computer that has achieved quantum supremacy.

“When two systems enter into temporary physical interaction due to known forces between them, and when after a time of mutual influence the systems separate again, then they can no longer be described in the same way as before. I would not call that one but rather the characteristic trait of quantum mechanics, the one that *enforces its entire departure from classical lines of thought*. By the interaction the two systems have become *entangled*.”

<sup>(5)</sup>*Department of Physics, Williams College, Williamstown, Massachusetts 01267*

(Received 2 December 1992)

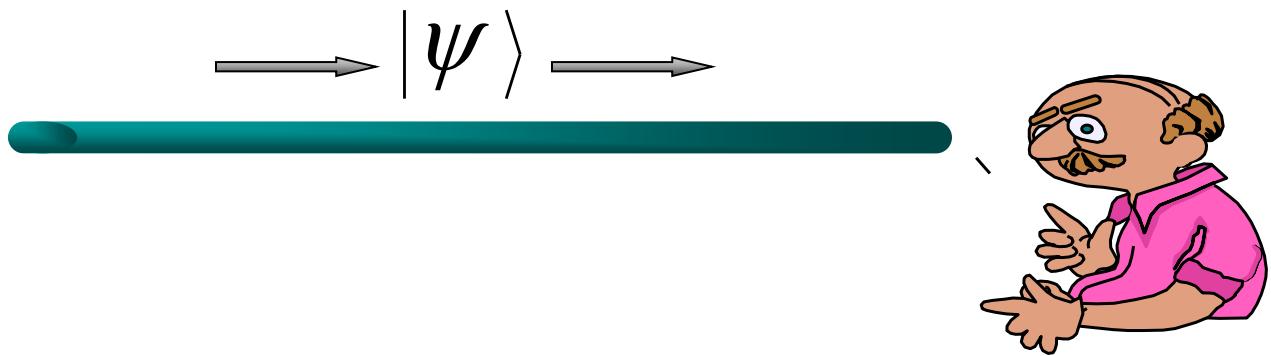

An unknown quantum state  $|\phi\rangle$  can be disassembled into, then later reconstructed from, purely classical information and purely nonclassical Einstein-Podolsky-Rosen (EPR) correlations. To do so the sender, "Alice," and the receiver, "Bob," must prearrange the sharing of an EPR-correlated pair of particles. Alice makes a joint measurement on her EPR particle and the unknown quantum system, and sends Bob the classical result of this measurement. Knowing this, Bob can convert the state of his EPR particle into an exact replica of the unknown state  $|\phi\rangle$  which Alice destroyed.

## RAPID COMMUNICATIONS

*The Rapid Communications section is intended for the accelerated publication of important new results. Since manuscripts submitted to this section are given priority treatment both in the editorial office and in production, authors should explain in their submittal letter why the work justifies this special handling. A Rapid Communication should be no longer than 4 printed pages and must be accompanied by an abstract. Page proofs are sent to authors.*

### Scheme for reducing decoherence in quantum computer memory

Peter W. Shor\*

AT&T Bell Laboratories, Room 2D-149, 600 Mountain Avenue, Murray Hill, New Jersey 07974

(Received 17 May 1995)

Recently, it was realized that use of the properties of quantum mechanics might speed up certain computations dramatically. Interest has since been growing in the area of quantum computation. One of the main difficulties of quantum computation is that decoherence destroys the information in a superposition of states contained in a quantum computer, thus making long computations impossible. It is shown how to reduce the effects of decoherence for information stored in quantum memory, assuming that the decoherence process acts independently on each of the bits stored in memory. This involves the use of a quantum analog of error correcting codes.

QANT NEWS TECHNOLOGIE APPLICATIONS KONTAKT JOBS LANGUAGE DEU

Quantentechnologien sind der Innovationstreiber des 21. Jahrhunderts.

Und Licht ist eine wesentliche Ressource, um dieses Potential zu nutzen.

Licht ist weit bekanntlich ein idealer Zugang zu Quantentechnologien. Daher steht Licht und photonische Quantentechnologie im Zentrum unserer QANTTechnologie, um damit neue Produkte in den Bereichen Sensorik, Imaging und Computing zu realisieren.

Um die beste Qualität in unseren Produktentwicklungen zu gewährleisten, kümmern wir uns um die gesamte optische Prozesskette. Diese fängt bei der Umwandlung von Elektronen in Photonen an, gefolgt von der Erzeugung und Ausnutzung von optischen Quanteneffekten und schließlich der Rückwandlung der Quantensignale in elektrische Signale und Daten.
